

INSULATIONS

VENTILATORS

A way to regulate the quality of the inside air, necessary in the residential buildings and in the dependences, it is that to promote a continuous aeration and independently checked by the strength of the wind.

To achieve finds her/it possible to insert some called elements "ventilators" whose role can be: "to correctly direct the flow of air and to prevent the entry of water and bugs or birds. You/they can be with fixed or adjustable opening and you/they can have additional elements for the correct acoustic attenuation. You/they can be positioned both in the frames and is in the continuous façade." I document Base HS Salute. Technical code of the housebuilding.

The "ventilators" they have an automatic secondary foil that closing the quantity of air is reduced in entrance when it increases the speed of the external wind. Besides, they prevent the formation of thermal bridges.

In commerce, different varieties exist with the purpose to guarantee suitable ventilation in every eventuality.
