

GLASSWORK

PARTITION MADE OF CAST GLASS PROFILES

The partition is delimited to horizontal steel frame with rectangular shape; on this frame, have been fixed, through anchors, some aluminum profiles with U shape. Over them, the pieces of cast glass are placed.

These pieces have eight stainless steel wires into them, to ensure the product is stiff.

To avoid the glass-metal contact, an elastic spacer is placed around 2 mm. of thickness.

After that, the plates are finished off on their top and the horizontal and vertical aluminum profiles with L shape are placed.

Finally, the joints are made with silicone sealant.
